(Biology 350, 2 undergraduate credits)
Travel to South Dakota, Montana, and Wyoming and explore the ecology and natural history of Yellowstone National Park. We will be working in the greater Yellowstone ecosystem. While on the road to Yellowstone, the group will stay at local motels (multiple occupancy) and stay at the Track Education Center in Gardiner, Montana once we reach the Park.

Focus of Study
Students will study the diverse biomes/life zones and ecology of the region, the geology of the region's geothermal features, and the natural and political issues that affect the Park. During the week in Yellowstone, students will cross country ski and snow shoe to explore wildlife and geologic features. You will attend workshops on winter ecology conducted by Dr. Halfpenny at the Track Education Center. During these workshops, students will perform field work and data collection in the Lamar Valley. Visits are also planned to explore the geothermal features of Mammoth Hot Springs as well as a snow coach tour of the geothermal features of various geyser basins in Yellowstone National Park.

Who can come
This course is open to all university students and anyone else who has a serious interests in these topics. Prerequisite: Biology 120 or 141 or consent of instructor

Mark your calendar and take this opportunity to experience the American West, to study ecology and geology, and to sample the spirit of this region of our country.
