Additional Information	The results obtained from a Xerox sponsored Chronic Toner Inhalation Study, demonstrated no lung change in rats for the lowest (1 mg/m ³) exposure level (i.e. the level most relevant to potential human exposure). A very slight degree of fibrosis was noted in 25% of the animals at the middle (4 mg/m ³) exposure level, while a slight degree of fibrosis was noted in all the animals at the highest (16 mg/m ³) exposure level. These findings are attributed to "lung overloading", a generic response to excessive amounts of any dust retained in the lungs for a prolonged period. This study was conducted using a specialtest toner to comply with EPA testing protocol. The test toner was ten times morerespirable than commercially available Xerox toner, and would not be functionally suitablefor Xerox equipment.
Special Remarks	This material has been evaluated by Xerox Corporation. The toxicity data presented in this section is based on test results of similar xerographic toners.
Toxic Effects in Humans	No additional remark.
