

Tips to Improve Internet Connectivity

1

Reboot Your Computer- Believe it or not, many issues can be solved with a simple system reboot!

2

Close Unneeded Applications- The more applications you are running, the harder your device is working to perform at top speed.

3

Minimize Your Connected Devices- Turn off the Wi-Fi connection on devices you are not using (phone, tablet, TV, etc).

4

Prioritize Household Internet Usage- If you are living with other people, ask them to limit their internet usage during your work time.

5

Use a Wired Connection- If possible, use an Ethernet cord to connect to the internet, it will always be faster than a wireless connection.
